

The Ideal Extension to Your Editorial Office

KNOWLEDGEWORKS EDITORIAL PRODUCTION

Outsource editorial services to Cadmus and lower the headaches and the cost!

Cadmus has exceptional copyediting and issue management resources for scholarly publishers who want to reduce schedules, eliminate the difficulty and expense of hiring and training personnel, and improve editorial quality and consistency.

Our copyeditors pass through a rigorous 6-month training program to qualify for editing complex scientific and medical content. To assist our editorial services team, the Cadmus development team has created an array of tools like Rapid Edit™ and Rapid Production Manager™ to support accurate and efficient copyediting and to reduce composition costs in production.

When you outsource issue management to Cadmus, we become an extension of your publishing operation. We maintain your style guide, resolve author queries and art concerns, coordinate production, produce reports, and remove all of the day-to-day worries.

Publishers and editors can focus on their primary responsibilities of content acquisition and distribution instead of hiring, training, and managing copyediting resources.

Our technical solutions deliver quality results and speed to publication

Cadmus delivers publishing expertise and technology tools that increase production efficiency while maintaining publication quality. We put these products to work every day in our production environment.

Rapid Edit automates standard corrections, so copyeditors concentrate on content

For many years, Cadmus has provided exceptional copyediting services to our customers. Based on this experience, we've created a variety of technical editing solutions for publishers.

Cadmus editorial services are the ideal extension to your editorial office

- Experienced staff with exceptional training
- Instant access to article status through our production tracking system
- Industry leading quality and schedules
- Reduced staffing expense

Our Rapid Edit products and services improve accuracy and efficiency in copyediting and reduce composition costs in production. Rapid Edit tools automate many repetitive style changes, corrections, and tagging for the copyeditor, leaving them free to focus on more substantive editorial tasks. Rapid Edit is customized to meet the specific standards of scholarly publishers and can be customized to each journal's distinctive style. Currently, Cadmus copyeditors use Rapid Edit to produce over 30,000 files annually for over 120 journals.

If you maintain in-house editing services, our electronic editing tools can make your copyediting teams up to 30% more efficient. These technologies can be licensed for your use or included in our services if you choose to contract with Cadmus.

Seamless process management through Rapid Production Manager™

Rapid Production Manager™ (RPM) is a unique content management system developed by Cadmus to provide workflow management and tracking of all production steps and production history. RPM seamlessly links the entire editorial and production process in a centralized end-to-end solution. RPM receives content manually or electronically from manuscript submission systems, manages files for multiple issues and production stages, sends automated emails and alerts, and generates reports and invaluable data for budget and performance tracking. RPM supports both conventional and XML production, and offers easy access to production essentials for telecommuters and freelance editors.

RPM is the foundation of Rapid Tracking, a web-based production interface that gives our customers access to real-time production data, updated immediately as articles pass through production steps. Similar to RPM, Rapid Tracking generates detailed reports that enable publishers to measure important budget and production

metrics. Using Rapid Tracking, Cadmus customers can also conveniently manage issue line-ups online, send changes to account managers, and access Rapid Proofs.

Bring on the "paperless" workflow!

The logical application of all available peer-review and production technology is an automated process of transferring materials from manuscript submission systems into production management systems. Cadmus has connected all the technology dots to achieve live paperless workflows that dramatically speed time to publication and minimize errors in production.

We've established paperless workflows for publishers using BenchPress, Manuscript Central, and E-Journal Press. Of course, our own Rapid Review™ is the only electronic peer-review system created by a full-service provider of publishing services and is specifically geared toward a complete paperless production process. When you're ready to go paperless and get the most out of publishing technology, our experienced staff can make it a reality. Visit www.cadmus.com for more information.
